RE: Patient Referral

Patient: Mr. Peregrine Vesey

DOB: 15/04/1955

NHI: VE11955

Dear Urology Team,

I am writing to refer Mr. Peregrine Vesey, a 70-year-old gentleman, for your specialist opinion.

Mr. Vesey initially presented a few months ago with urinary frequency and some difficulty initiating micturition. These symptoms have been progressively, albeit slowly, worsening. He now reports needing to void multiple times overnight, which is beginning to disrupt his sleep significantly.

His initial PSA was slightly raised for his age at 4.5 µg/L. A digital rectal examination was unremarkable, with a smoothly enlarged prostate consistent with benign hypertrophy. We repeated the PSA after 6 weeks, and it has risen to 5.1 µg/L.

Of note, a routine renal function test as part of a general check-up last month showed a slight impairment in his kidney function compared to his baseline from two years ago. An ultrasound was arranged, which noted a degree of fullness in the collecting system of one kidney, though it was not described as frank obstruction. There is no history of renal colic or stones.

Given the combination of his progressive lower urinary tract symptoms, the steady increase in his PSA level, and the new finding on his renal imaging, I believe he would benefit from a formal urological assessment.

Thank you for your attention to this matter.

Yours sincerely,

Dr. Eleanor S. Vance
